SUMMARY

Unity gameplay and live-ops engineer with 4+ years building mobile games in C#. At Dot9 Games, builds league, clan, party, tournament and monetization systems for a live multiplayer FPS and a social games hub. Earlier shipped a Ludo-style board game with a bot-vs-bot balancing simulator, a bilingual story-puzzle game, and a solo physics puzzle game with Firebase live-ops.

SKILLS

C#, Multiplayer (Photon PUN), Shader Graph, UI / UX, Profiling & optimization, Lighting / World Design, OOP, Debugging

EXPERIENCE

Game Developer, Dot9 Games

Apr 2025 to Present · Mumbai, India

FAUG: Competitive Multiplayer FPS

- Built the client for the FAU-G Bharat League (FBL), a weekly league that led to two offline e-sports season finals: flow, Firestore calls, promotion and demotion transitions, failure-handling UI, percentile leaderboards, and a remote-config bot handler that simulates league points.
- Developed the clan layer on Firestore (create, join, invite, disband, missions, daily login tracking), then the Teams system: invite-based match leadership, party matchmaking, live loadout sync, and server-owned team chat with reporting.
- Engineered the Photon connection layer: best-ping region selection, Play Again restart, master-client takeover on heartbeat loss, high-ping drop to offline mode, and fixes for matchmaking bugs such as stale team indices.
- Created the offline tournament system for a live finals event: Firestore data model, room-code match setup, player seating by user ID, score posting at game over, and device-aware control layouts.
- Rewrote the multi-reward grant logic, built the reward UI for skins, accessories and multi-item rewards, and integrated a third-party reward-claim flow with its result-page and main-menu UI.
- Led the battle-streak feature with one junior developer, designing the system and building the streak logic, flow and most of the UI.
- Designed and built the targeted announcement system end to end: Firestore calls, trait-based personalized messages, global broadcasts and the UI.
- Integrated PlayFab TitleData as the remote-config layer, so values change without a new build, and set up the client system for A/B tests on PlayFab Experiments, serving different TitleData to a share of the audience so the team could compare reward and feature performance.
- Integrated AdMob and Unity Ads behind JSON-configured placements, In-App Review prompts, and a JSON-driven Firebase Analytics layer plus AppsFlyer events.
- Reworked the third-person camera (blend, wall collision, aim reticle fixes) and added a grenade package.
- Added cheater flagging, player and chat reporting, username validation, and a QA test-device tool.
- Diagnosed and fixed an overdraw bug with the Frame Debugger: alpha in wall textures made the renderer draw geometry behind walls.
- Sped up scene loading (load-time instrumentation, scene reuse on Play Again, mipmap streaming); added a one-command Android build and design docs for Teams, Play Again, leaderboards and tournaments.

Chapter 26: Casual Multiplayer Games & Social App

- Built the client for a remote-config-driven mini-game hub covering social, tournaments, leaderboards, achievements, daily tasks, rewards and a store, shipped with the team in a few months.
- Implemented the clan client: member actions (promote, demote, kick), requests, invites, search and profanity checks, with right-to-left layouts.
- Wrote the tournament and leaderboard flows (state, individual, all-games and city views, score posting, winner pages) against the backend API.
- Delivered Arabic localization and right-to-left layouts across the hub, store and clan screens.
- Shipped monetization and account flows: ads with a remote-config live and test switch, a runtime-built store, force and soft update gating, OTP rate limiting, and in-app account deletion.
- Added a QR scanner and generator for check-ins and a live-cast page; fixed crashes and game-exit bugs across Baloot, football penalty, Carrom and Ludo.

Mahabharat Board Game: Ludo-Style Strategy Game

- Developed a Ludo-style strategy board game with 2 and 3 player bot matches, 7 battlefields with day and night variants, 25 ScriptableObject power-ups, path-finding over four board layouts, and rewind and reroll turn-state snapshots.
- Created a headless bot-vs-bot simulation framework that exports win-rate, event and power-usage CSVs for balance analysis, alongside an event-driven weighted-RNG dice system and bot power-selection weights that tune difficulty and game feel.
- Delivered the meta-game and services: XP, achievements, daily missions, loot chests, challenge modes and a guided tutorial, plus Firebase Auth, Google Play Games, AdMob, Unity IAP and push notifications.

Puzzles of Mahabharat: Bilingual Story-Puzzle Game

- Engineered a bilingual (English and Hindi) narrated story-puzzle game with 375+ story pages, 126 image puzzles and 50 jigsaws, driven by a CSV pipeline so the content team adds levels without code changes.
- Wrote 10 puzzle types (rotation, grid, hexagon, circle, hybrid and more), Hindi font conversion, and runtime language switching with per-language voice-over loading.
- Implemented Firebase login and cloud save with timestamp-based conflict resolution, plus AdMob, Unity IAP, Google Play Games, a rewards SDK with an offline retry queue, and Android App Bundle builds.

Indie Game Developer, Immersiveorama

2022 to 2023, updates to Feb 2026 · Mumbai, India

Steady Light: Solo 2D Physics Puzzle Game (Unity 6)

- Solo-developed the game and published it on the Play Store in Oct 2022: about 45 levels across 6 worlds, a library of about 30 reusable obstacle components, touch controls on the new Input System.
- Architected it for fast content: ScriptableObject event channels, a custom reflection-based dependency injector, and Addressables-streamed levels defined as data.
- Ran it as a live game, with updates through Feb 2026: Firebase Remote Config for balance changes without app updates, and Firebase Analytics with per-level timing.
- Handled the rest solo, from a tamper-detecting save system (SHA-256), async UI sequencing (UniTask) and custom Shader Graph shaders to 2D lighting and animation, using purchased art and VFX packs.
- Self-taught Unity during the 2020 lockdown after a VFX role ended; published a first game in Oct 2020 (since removed from the Play Store) before building Steady Light.

VFX Artist, Cinegence Media Pvt. Ltd

Aug 2019 to 2020

- Worked as a compositing and clean-up artist in post-production on several films and TV shows.
- Produced VFX sequences under tight deadlines that fit cleanly into the final shots.
- Used Nuke for CG effects and simulations, working with animators to keep scenes consistent.
